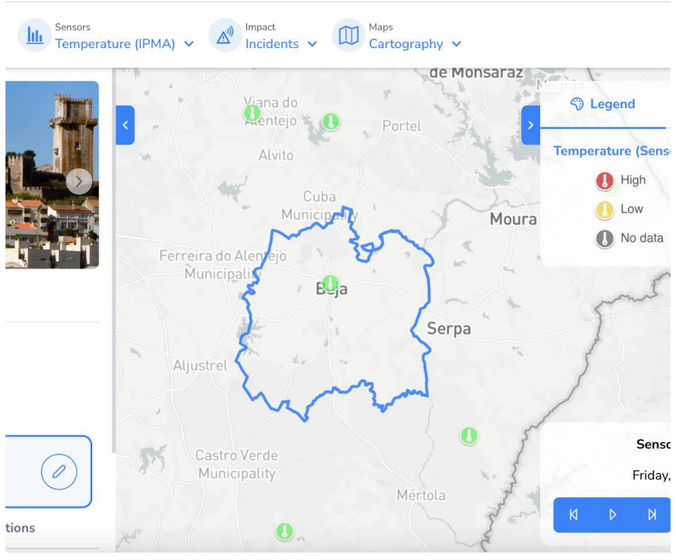
RESIST

Regions for climate change resilience through Innovation, Science and Technology

Baixo Alentejo LSDT3 Solutions

Powerful tools to prepare the region for extreme heat!

Baixo Alentejo, part of the Alentejo region (NUTS II), faces high climate vulnerability, with extreme heat and water scarcity as the most critical risks. Baixo Alentejo falls into the "high susceptibility" risk class. Droughts are recurrent climatic events in the region due to long periods of low precipitation, creating phytosanitary problems, concentration of pollutants in water bodies and desertification. Investments made in the last years created water storage systems to cope with the scarcity, but more investments must be promoted in order to face future challenges.



Argos System

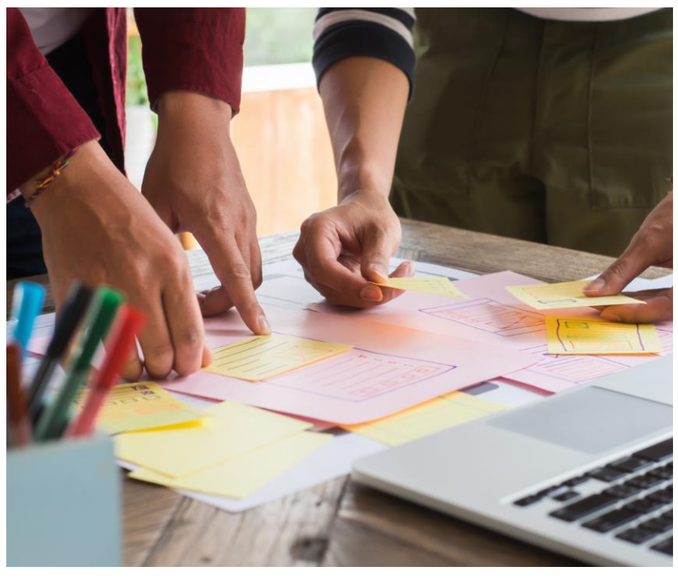
Argos will support decision-making (digital platform) for emergency managers and other stakeholders, with the aim of anticipating impacts and better managing climate-related emergencies caused by climate change.

Argos is being adapted to focus on high temperatures and heat waves and will be applied to better analyse past events, better identify vulnerable areas, and plan specific PIAAC-BA actions and measure updates.

Citizen Participatory Toolkit

The toolkit aims to strengthen communities by promoting inclusive participatory processes and social actions that address natural hazards, climate change and civil protection participation.

This solution will be applied at different levels of governance and within a wide range of social organisations, regardless of their size or structure.



Every adaptation action taken today strengthens the region's future and the resilience of the community.

Baixo Alentejo LSDT4 Solution

Integrated Areas of Landscape Management (AIGP)

AIGP is a comprehensive approach aimed at promoting the collective management and utilisation of agroforestry spaces in smallholdings and areas with high fire risk. This approach is grounded in an integrated territorial strategy that addresses the need for effective landscape planning and management.

It aims to increase the area of managed forest at a scale that enhances resilience to fires, boosts natural capital, and in a way that supports the rural economy.

The solution

This solution is a planning and management tool designed to promote the shared use of agroforestry spaces with high fire risk.

It combines landscape planning, forest management, and community engagement to enhance resilience to fires, boost natural capital, and support the rural economy.

Operations follow a clustered management model tailored to specific territories under a dedicated management entity and key components include participatory governance, fire risk assessment and technical planning, landscape restoration, biomass valorisation, and sustainable business models that foster rural entrepreneurship and economic development.

The pilot

CIMBAL is applying the model on the Contenda farm (with public-municipal management) by implementing technical training actions and providing the resources needed to mobilise and support rural landowners, including support for crop reconversion operations (e.g. reconversion to species that are more adapted and resilient to water scarcity and high temperatures such as the arbutus tree) and actions that promote the enhancement and revitalisation of the territory.

Promotion of sustainable landscape management in areas most susceptible to fires
